

WinCloak is another new and innovative solution from ScriptLogic Corporation that allows users to only see files and folders that they have permission to access.

WinCloak™ (formerly ScriptLogic Cloak) is an innovative software product that enhances the Windows NT File System (NTFS) by providing increased security, more accurate audits and a vastly streamlined experience for users of the network.

INCREASED SECURITY

Simply put, WinCloak provides increased security on NTFS volumes by adding "Out of sight out of mind" filtering to the Windows file system. Once WinCloak is installed on your Windows Servers, users will only see the files and/or folders that they have permission to access.

STREAMLINED EXPERIENCE FOR USERS

In addition to tightening security, WinCloak also helps to streamline your users' overall experience. Since users won't see folders and/or files that they can't access, their directory trees are measurably less cluttered. They'll receive less "Access Denied" messages because they can't click on folders that are hidden from their view (whether their attempt was intentional or accidental).

MORE ACCURATE FILE AUDITING

If you have enabled File System Auditing, WinCloak will also help by virtually eliminating any 'false positives' in

your security event logs.

Now when you review event logs and see "Object Access - Failure" entries, you can actually pay attention since the "I clicked on that folder by accident" excuses will no longer be accepted.

EVEN MORE BENEFITS

WinCloak is easily installed to Windows 2000/2003 Servers and its functionality can be enabled on individual disk volumes. In addition to filtering network requests on file servers, WinCloak can also filter local activity, making it an ideal solution for Terminal Servers and Citrix MetaFrame. WinCloak does not require user-specific configuration nor the installation of software agents onto their desktops.

F.A.Q.

What Operating Systems are supported by WinCloak?

WinCloak can be installed to your Windows 2000 and 2003 Servers. Because it monitors all inbound network requests, all Win32 client operating systems are supported (Windows 95, 98, Me, NT 4.0, 2000, and XP).

Does WinCloak only filter requests from Windows Explorer?

No. WinCloak is both Operating System and application independent.

Regardless of the application on the client that sends the request, WinCloak will filter out the files and folders before sending the response back to the client.

Will WinCloak filter requests locally and from the network?

Yes. Using the WinCloak Manager, you can choose whether to filter only local requests, only network requests or both local and network requests to the host server. You also have the option of selecting whether to filter files, folders or both files and folders on at a volume level.

LICENSING

WinCloak is licensed on a per server basis. It is not necessary to run WinCloak on every server, just the ones that you wish to restrict file access on.

For pricing contact your ScriptLogic reseller or call ScriptLogic at **1.800.813.6415** or **1.561.886.2420**.
